# ROLLOUT

## Wiping out the Dried Ink & Cured Adhesive on rollers.

**Rollout** is a non-flammable blend of safe, biodegradable solvents designed to tackle the toughest cleaning problems. Although **Rollout** can be used for various applications, there are two main uses:

### Adhesives

**Rollout** is widely used for cleaning laminating adhesives, especially solventless adhesive. With its waterless ingredients, **Rollout** is able to penetrate the surface but has less evaporative properties than harsh solvents like Ethyl Acetate. This means that it is able to have longer surface contact, lower usage and VOC's, and is more effective with less smearing. In addition, **Rollout** has been found to be highly effective on urethane-based products such as hot melt PUR, inks and resins, coatings, and more.

### THICKENED ROLLOUT

Another version called **Thickened Rollout**, which has a higher viscosity, can be used for vertical surfaces, overspray, tough places to clean where parts are not easily removed, and areas that need longer surface contact and dwell time.

### Dried Inks

Unfortunately, many printing companies have felt the effects of dried ink on their rollers and cylinders. To minimize press downtime, **Rollout & Thickened Rollout** work effectively to rewet the surface and pull the ink from the plugged cells.
